

Agribusiness, rural development and economics

Rapid changes in technology, markets, climate, geopolitics, society and food security are creating both challenges and opportunities for agriculture.

UQ researchers address these challenges by advancing economic, social and environmental sustainability through research excellence, innovation, partnerships and training.

Our agribusiness researchers develop whole-of-system strategies for a sustainable, competitive food system, drawing on expertise in farming, marketing, finance and supply chain management.

Our social scientists support gender-inclusive processes, practice change and agricultural innovation, while our agricultural economists provide evidence-based analysis and tools to inform policy, trade, international development, and agricultural and natural resource management.

Through collaborations with farmers, industry, policymakers, development agencies and research partners, we work to create positive outcomes for people, communities and the environment.
